14 Glossary and support

Quick path Managers: sections 2-9. Technicians: sections 2, 10 and 11. Section 12 covers common problems.

1 About SmartJob

Verteco SmartJob tracks a job card from scheduling and assignment through field work, evidence, sign-off and manager approval. Managers use the hosted web console. Technicians use the installed app. Both clients call the same hosted API, which stores job records in Azure SQL and confirmed files in Azure Blob Storage.

Component	Purpose
Manager web console	Create jobs, monitor status, manage technicians, review evidence, download job cards and reports.
Technician app	Sign in, work assigned jobs, update checklist sections, capture equipment, comments, evidence and signatures.
Hosted API	Applies permissions and job rules, serves both clients, and stores shared records and confirmed files.

Job status at a glance

Draft -> Assigned -> Accepted -> In progress -> Awaiting approval -> Completed. A manager can reopen work for rework. A permitted active job may be cancelled. A flag can appear at any stage and must be reviewed separately.

Data in figures Screenshots show project sample records as they appeared on 5 October 2026. Names, dates and counts in your account may differ.

2 Access and sign in

Manager web console

Open the live web app: https://verteco-smartjob-web-ctatfjduapbcdzb5.southafricanorth-01.azurewebsites.net

1. Enter your SmartJob work email and password, then select **Sign in**.
2. If you cannot remember the password, choose **Forgot your password?** and enter your work email. The reset link expires after one hour.
3. After sign-in, use the left navigation for Dashboard, Job Cards, Status Tracking, Flagged Items, Technicians, Reports and Profile & Settings.

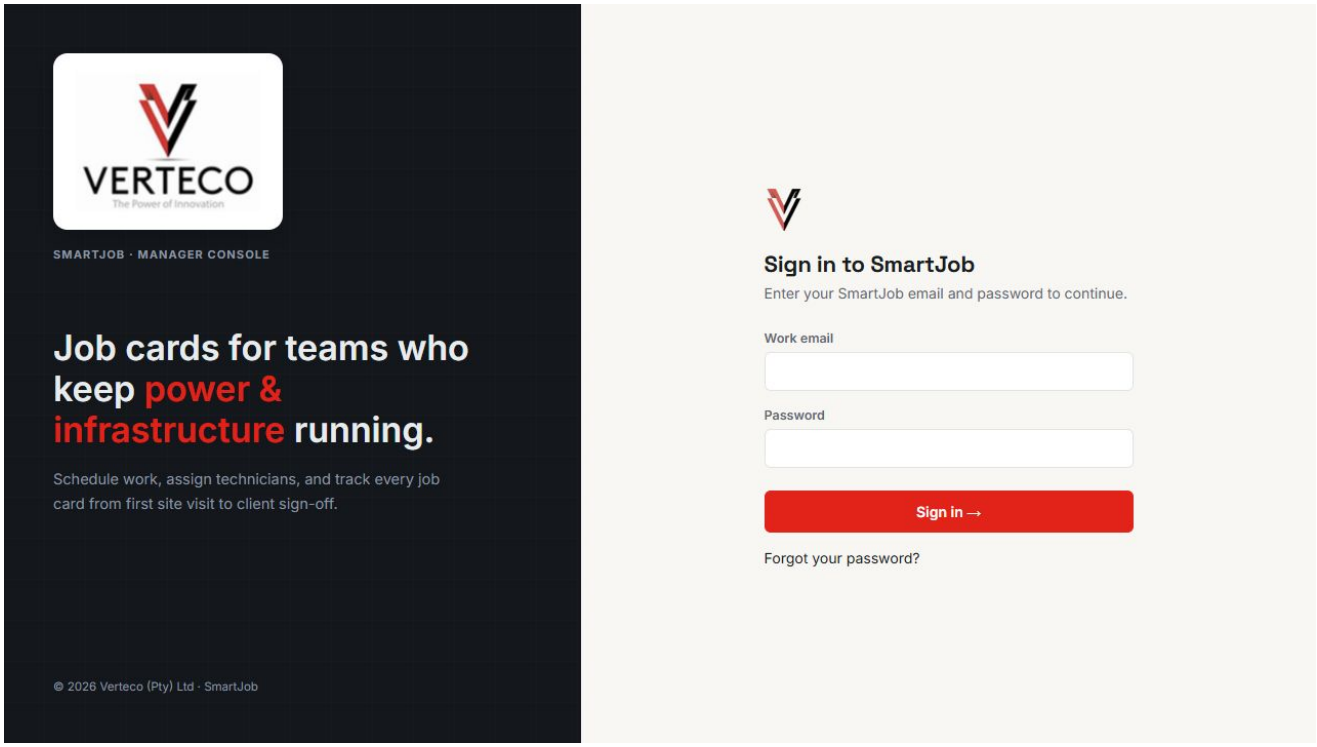

Figure 1. Live hosted web sign-in page; captured without entering credentials.

Technician app

1. On an Android phone, open the team's SmartJob Android Build workflow on GitHub. Select the latest successful **main** or **develop** push run (or successful manual run).
2. At the bottom of that run, under **Artifacts**, download **smartjob-android-apk**. Sign in to GitHub if prompted. Extract the downloaded ZIP and transfer the APK to the Android phone if you downloaded it on a computer.
3. On the phone, open the APK from Files/Downloads and choose **Install**. If Android prompts, allow installs from that source for this installation, then turn that allowance off again. Open SmartJob after installation.
4. Ask a manager to create your technician record and set the linked account password in **Technicians** on the web console.
5. Open the app and sign in with that technician email and password. Use the same account each time so your assigned jobs appear.

Build and password help Use a signed APK from a successful push or manual run; pull-request runs build an unsigned APK. The workflow retains the artifact for 14 days. An APK installs on Android, not Windows. The mobile sign-in screen has no reset link; a manager can set a new technician password.

3 Manager dashboard

The dashboard shows active job cards, jobs due today, flagged jobs requiring review and available technicians. Recently scheduled jobs link to their details; Quick actions open common tasks.

1. Review the four summary cards at the top of Dashboard.
2. Select a recent job card, or select **View all job cards** for the searchable list.
3. Use Quick actions to create a job card, manage customers, open Status Tracking or review flags.

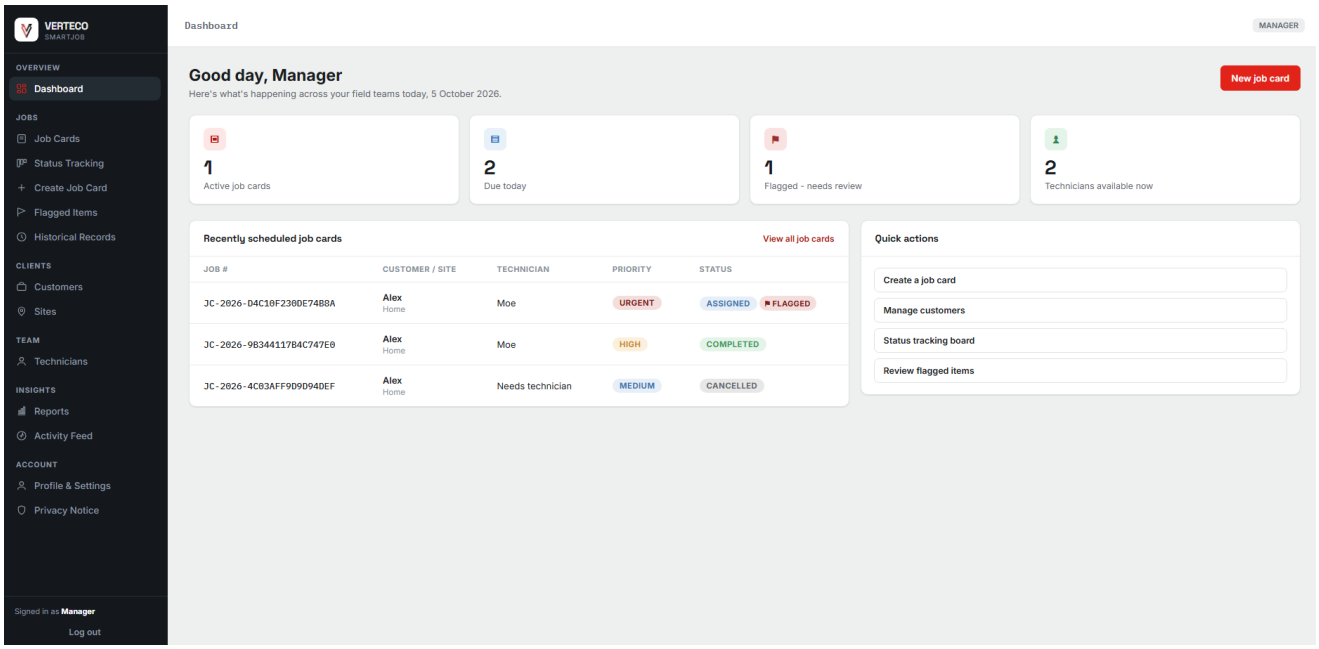

Figure 2. Current manager Dashboard, showing summary cards, recent jobs and quick actions.

4 Create and assign a job card

Every new job uses the single **Standard Job Card** checklist. A manager chooses the customer and site, priority and scheduled date; assigning a technician during creation is optional.

1. Open **Create Job Card** from the sidebar or Dashboard.
2. Choose a customer and then one of its sites. Use **New customer** or **New site** on the form if needed.
3. Set priority and scheduled date. Select a technician if ready, add useful notes, and select **Create job card**.
4. If the job is still Draft, open its details and assign a technician. The assigned technician then sees the job in the app.

Standard checklist

Stage	Standard task
Safety	Confirm site access and safety controls
Equipment	Record equipment and serial numbers
Work	Complete installation, inspection or maintenance work
Tests	Record test results and outstanding issues
Evidence	Capture photographic evidence
Sign-off	Obtain technician and client sign-off

Checklist order Technicians confirm each task after doing it. Photos and signatures are captured on later screens; they are checked before final submission.

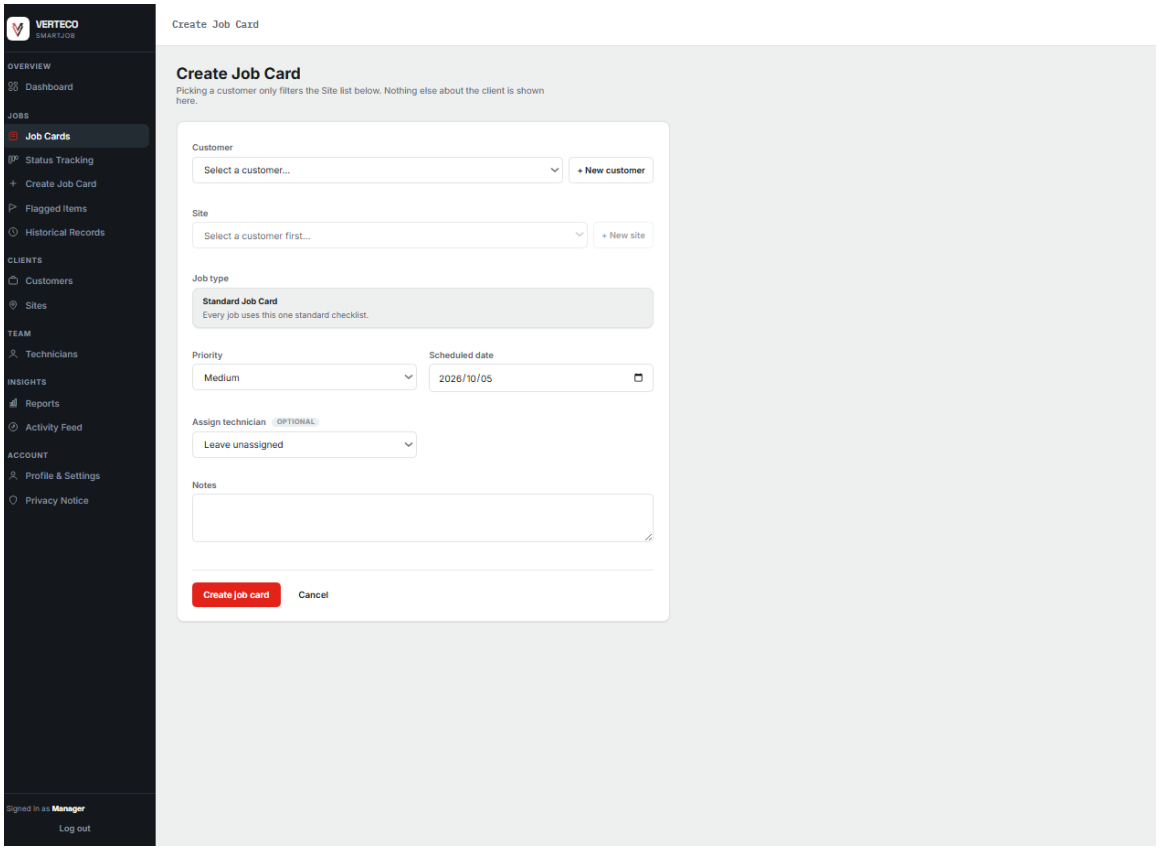

Figure 3. Create Job Card form with customer, site, priority, schedule and technician assignment.

Customers and sites

Use **Customers** to search customer records and view their sites. Use **Sites** to find locations and their equipment. A site belongs to one customer; when creating a job, choose the customer first so the form filters the site list. Managers can add a customer or site from the job form or its dedicated list.

5 Find, track and flag jobs

Job Cards and Status Tracking

1. Open **Job Cards**; search by job number, customer or site. Narrow the list with status, priority and flagged filters.
2. Select a row to open details. For an overview of all stages, open **Status Tracking**.
3. Select a card on the status board to inspect that job. The board groups jobs by Draft, Assigned, Accepted, In progress, Awaiting approval, Reopened and Completed; Cancelled appears when present.

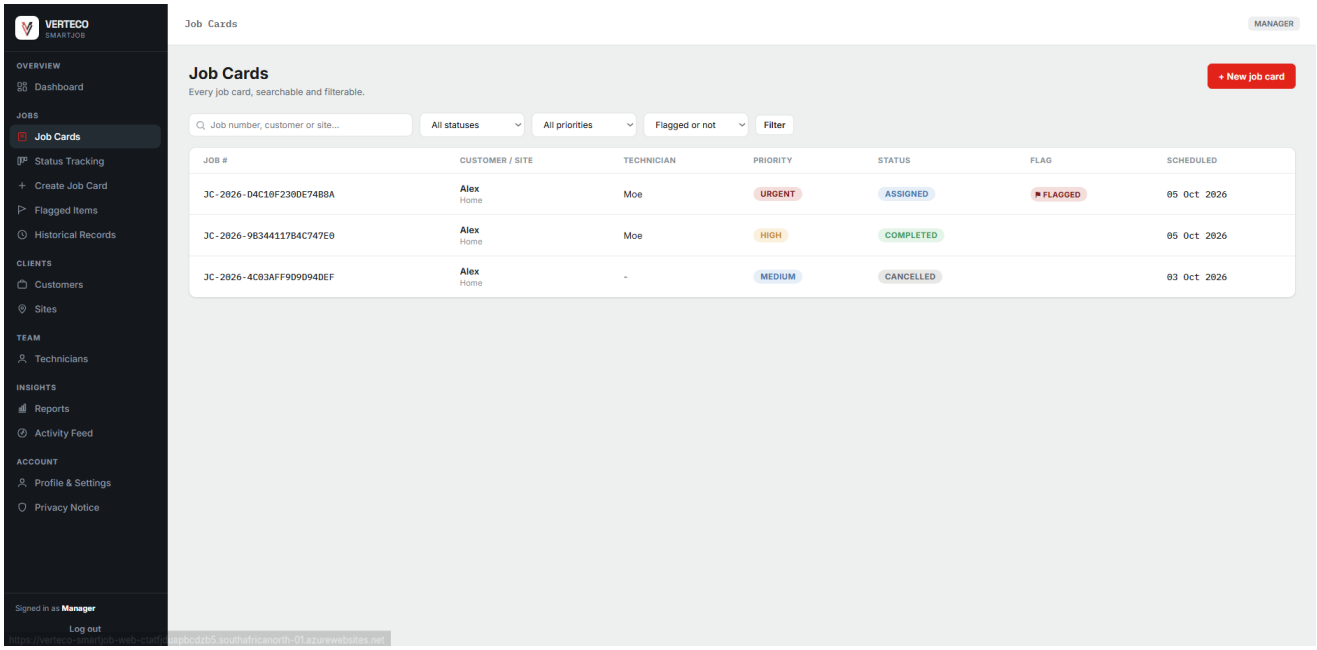

Figure 4. Job Cards list with search and status, priority and flag filters.

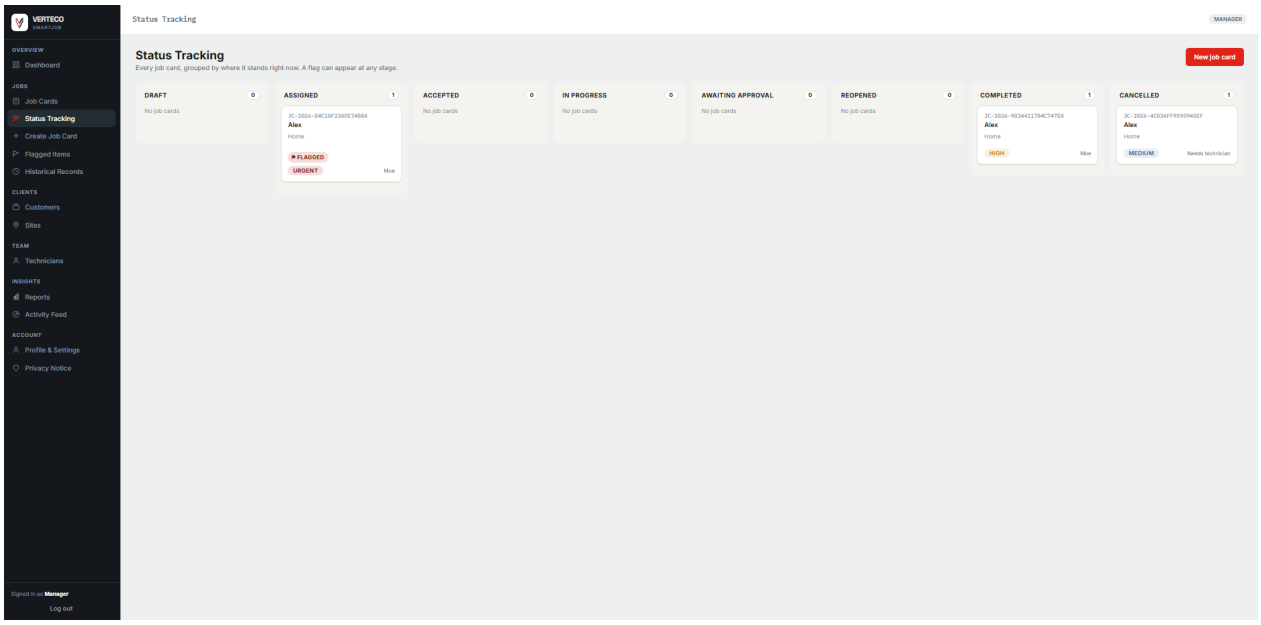

Figure 5. Status Tracking groups job cards by their current stage.

Flags and corrective action

A technician can raise an issue during field work; a manager can also flag a job from its detail page. Open **Flagged Items** to review unresolved issues. On the job card, read the reason and enter resolution notes when the corrective action has been completed. An open flag blocks approval.

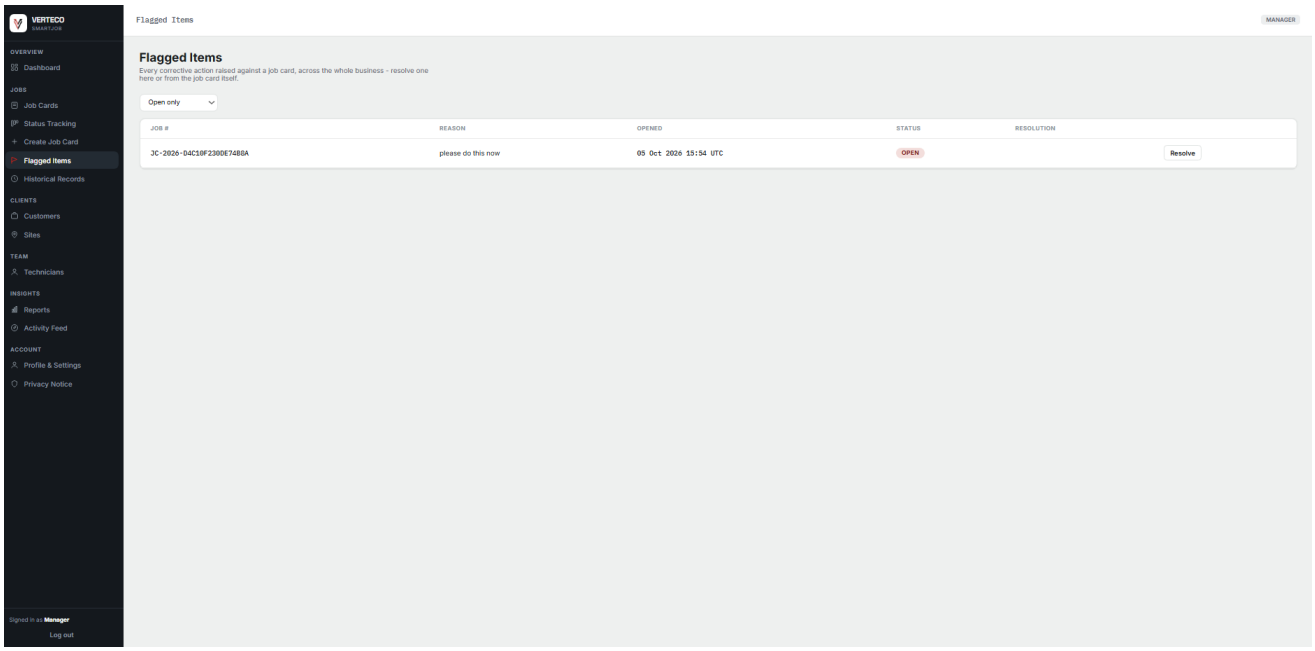

Figure 6. Flagged Items shows unresolved corrective actions.

Historical Records

Open **Historical Records** and search an equipment serial number to find that asset's service history. Open a result to inspect the earlier job card. This helps when planning repeat visits or checking warranty work.

6 View evidence and the full job card

The manager can view confirmed photos and signatures on the job details page and in a full job-card view. The full job card includes customer and site, schedule, field equipment, comments, checklist, evidence and sign-off.

1. Open **Job Cards** and select a job number.
2. Under **Evidence and signatures**, select **View evidence** or **View signature** to open an individual confirmed file.
3. Select **View full job card** for the printable web layout with photo and signature previews.
4. Select **Download PDF** to save the complete job card. The PDF includes confirmed image evidence and signatures when available.

> **If files are absent** A photo or signature appears to the manager only after the technician's upload and confirmation succeeded. Refresh the job card after the technician reconnects and completes that step.

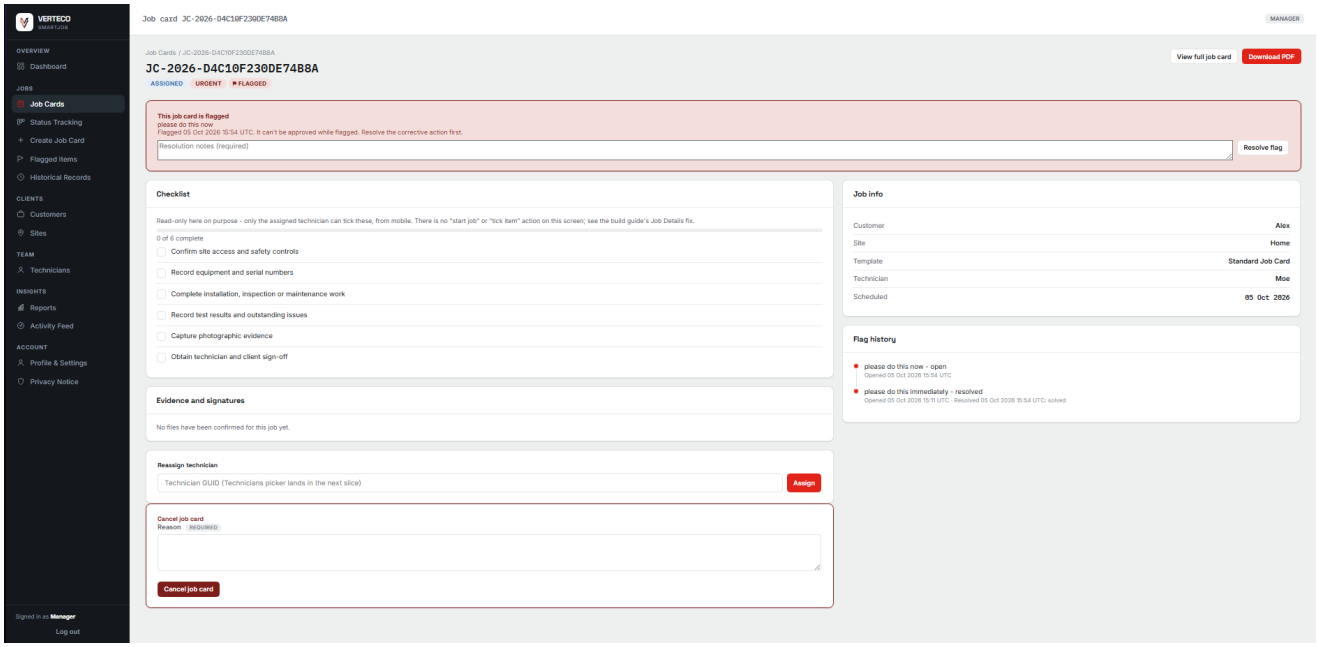

Figure 7. Manager job details, including checklist, evidence, View full job card and Download PDF.

7 Review, approve and reopen

A submitted job reaches **Awaiting approval**. The manager reviews the checklist, field notes, evidence, signatures, flags and revisions before deciding.

1. Open the Awaiting approval job. Check the full job card and each evidence and signature link.
2. If the work is acceptable and no open flag remains, add optional review notes and select **Approve & complete**.
3. If rework is needed, enter a required reason and select **Reopen for rework**. The technician sees the reason and can resume the job.

Reopened jobs Existing checklist entries, equipment details, comments, photos and signatures remain on the job. The technician can edit eligible details, change captions, remove and replace evidence or signatures, and resubmit.

8 Reports and AI commentary

Managers can open **Reports** for a calendar month. The report shows jobs created and completed, average completion hours, status counts and AI commentary when the provider is configured and available.

1. Open **Reports** and choose the year, then select a month.
2. Read the statistics and status breakdown. Read AI commentary when present; its status message explains when it is unavailable or rate-limited.
3. Select **Export CSV** for statistics or **Export PDF** for a branded monthly report. The PDF includes commentary when it is available.

Availability Report statistics and PDF download remain available when AI commentary cannot be generated. The commentary is advisory; the manager makes the review decision.

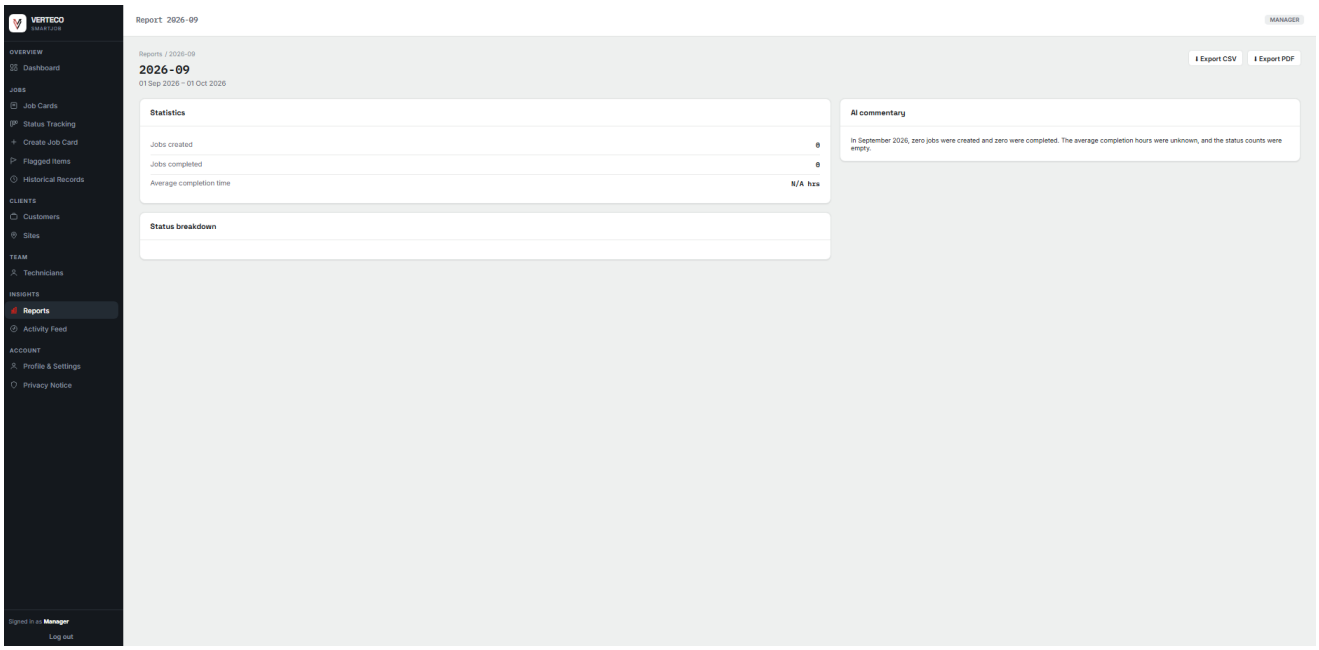

Figure 8. Monthly report with statistics, AI commentary and CSV/PDF exports.

9 Technicians and account settings

Create a technician and enable sign-in

1. In the web console, open **Technicians** and select **New technician**.
2. Enter full name, email, phone, availability and skills. Creating the technician also creates a linked user account.
3. Open that technician's detail page. In **User account**, set and confirm the sign-in password, then share it securely with the technician.
4. The manager can later edit the roster details, suspend or reactivate the account, or set a replacement password.

Profile & Settings

A signed-in web user can change full name, sign-in email and phone. Changing email requires the current password. The page also links to password reset and logout. The mobile Profile page shows technician details and offers logout; it does not edit account fields.

Activity Feed and Privacy Notice

Activity Feed shows recorded actions such as sign-ins, job flags, password changes and account updates with timestamps. **Privacy Notice** explains what personal and job information SmartJob stores, why it is retained and how access is protected. Managers should use these pages when reviewing account or record questions.

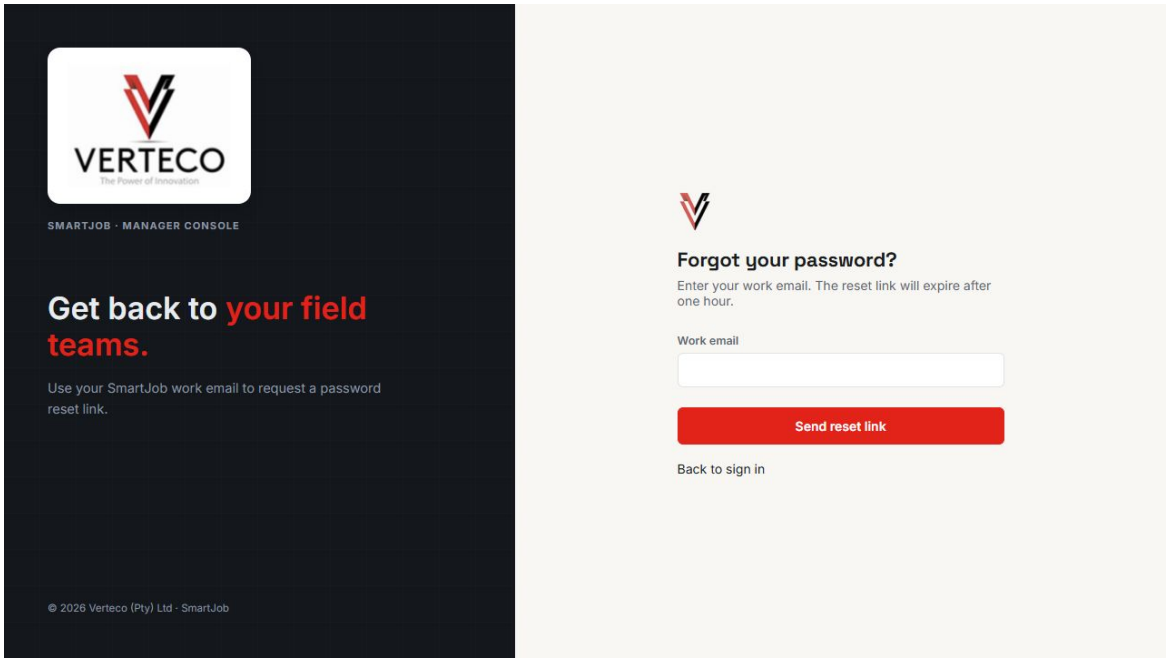

Figure 9. Live web password-reset request page.

10 Technician app workflow

The current technician app uses the hosted API at the address in section 13. Work begins from **Technician Dashboard** and **View My Jobs**.

1. Open an assigned job and review the customer, site, priority, schedule and notes. Accept the assignment and start the job.
2. Work through the checklist. Mark a section's task after the work is done; do not mark the evidence or sign-off tasks before reaching those screens.
3. Record equipment and serial number, then add comments or flag an issue if needed.
4. On **Photo Evidence**, take or choose a photo, add a description and continue. The app uploads and confirms the file with the API. Saved photos can be reviewed, recaptioned or removed while editing is allowed.
5. Capture and confirm the technician and client signatures on **Signatures**. Existing signatures can be viewed, removed and redrawn during rework.
6. On **Review & submit**, inspect the summary, confirm you reviewed it and submit while online. Any unfinished checklist task is shown as an error.

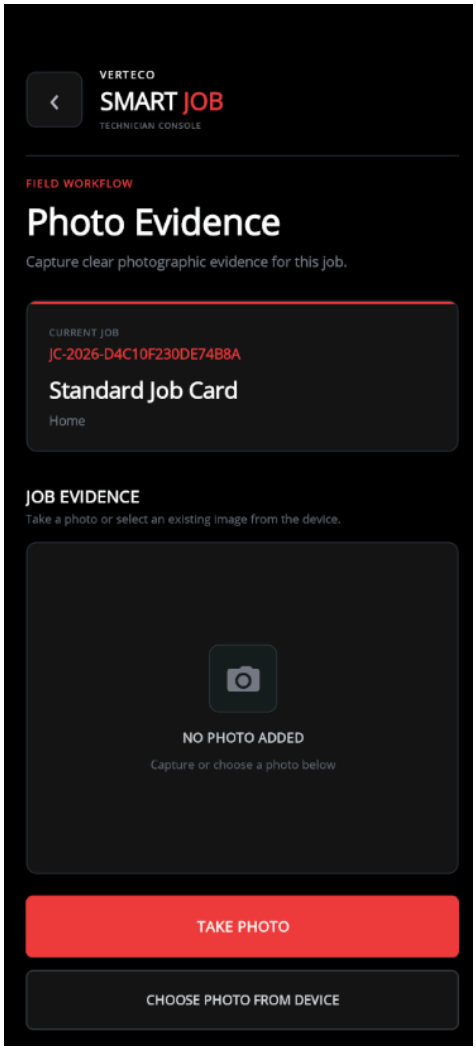

Figure 14. Photo Evidence capture.

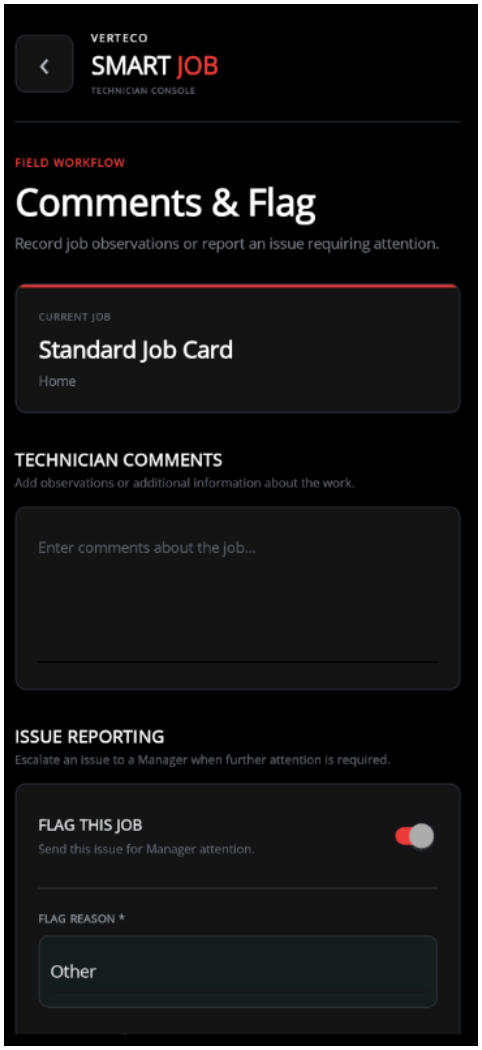

Figure 15. Comments and issue flag.

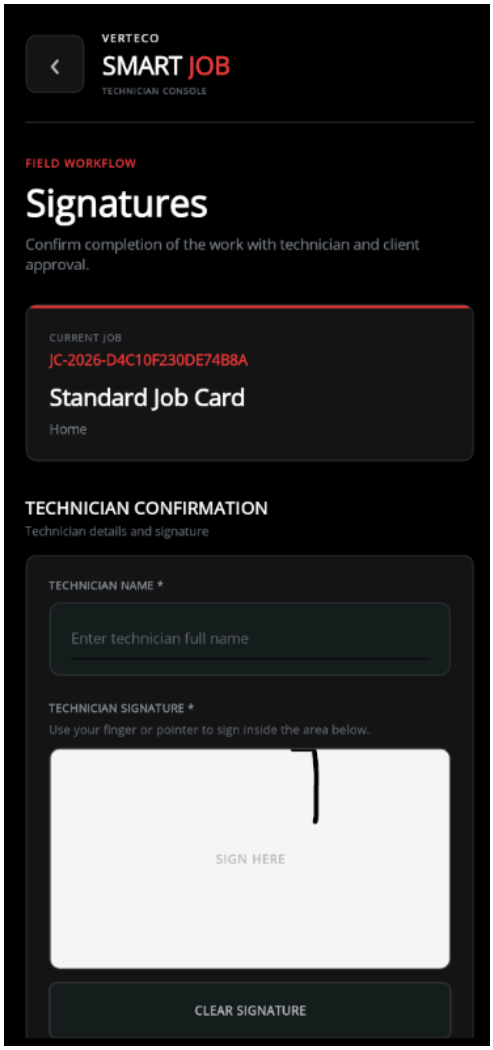

Figure 16. Technician signature.

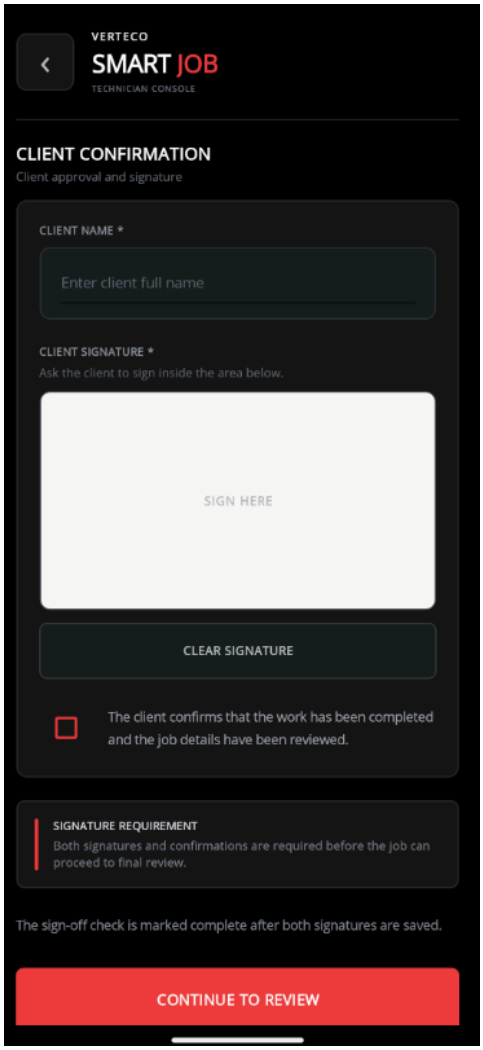

Figure 17. Client signature and confirmation.

11 Rework and offline sync

When a manager reopens a job

1. In My Jobs, open the Reopened job and read the manager's reason.
2. Select **Resume reopened job**. The saved field data loads from the API; edit what needs correction.
3. Revisit photos and signatures to keep, replace or remove them. Check the complete record, then submit again while online.

Offline Sync

The app has an Offline Sync page showing connection status, pending changes and conflicts. Checklist changes can be stored locally and pushed later. Select **Sync now** after reconnecting and check the status or conflict count. Assigned jobs can be pulled into the local cache.

> **Connection required** The current app does not queue photo or signature uploads or final submission. Those steps require a connection. A connectivity indicator alone does not prove that a pending change reached the server.

Notifications

Open the bell on Technician Dashboard to review in-app notifications and mark them read. SmartJob also sends job emails from **vertecosmartjob@gmail.com** in the current deployment. When a technician submits or flags a job, the notification goes to each active manager's SmartJob sign-in email address. Assignment, approval and reopening emails go to the technician's account email address. Check that your sign-in email is current in **Profile & Settings** so manager notifications reach you.

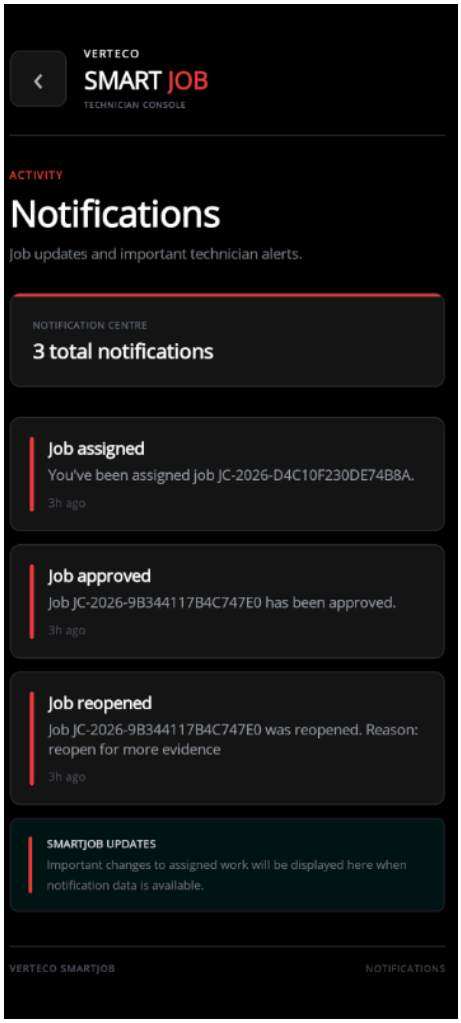

Figure 18. In-app assignment, approval and rework notifications.

12 Troubleshooting

Problem	What to do
Cannot sign in to web or app	Check the correct email and password. Ask a manager to confirm the technician's linked account and password. The hosted API must be reachable.
Forgot web password	Use Forgot your password? on the web sign-in page. If no email arrives, contact the administrator to check email delivery.
Manager job email not received	Check the inbox and spam folder for vertecosmartjob@gmail.com. Confirm the manager's sign-in email in Profile & Settings and ask the administrator to check mail delivery if needed.
No assigned jobs	Refresh My Jobs, check connection and confirm the manager assigned the job to the signed-in technician.
Photo/signature absent in web	On the app, reconnect and complete upload/confirmation. Then refresh the manager's job detail page.
Cannot submit	Complete remaining checklist tasks, confirm review, ensure photos and signatures succeeded, and submit online.
Reopened data appears missing	Reconnect and reload the job before editing. Saved evidence and signatures must load from the API.
Offline changes not on server	Open Offline Sync and select Sync now after reconnecting. Inspect conflicts and verify the server job afterwards.
AI commentary unavailable	Statistics and exports still work. Check the report's AI status and ask the administrator to review provider configuration if needed.

13 URLs and technical notes

Address	Use
Hosted web app	https://verteco-smartjob-web-ctatfjduapbcdzb5.southafricanorth-01.azurewebsites.net
Hosted API	https://verteco-smartjob-api-hcdyfgf4cagdh2db.southafricanorth-01.azurewebsites.net The installed technician app calls this address.
API readiness check	https://verteco-smartjob-api-hcdyfgf4cagdh2db.southafricanorth-01.azurewebsites.net/health/ready For maintainers; confirms database and Blob dependencies.
Web sign-in	https://verteco-smartjob-web-ctatfjduapbcdzb5.southafricanorth-01.azurewebsites.net/Account/Login
Web password reset	https://verteco-smartjob-web-ctatfjduapbcdzb5.southafricanorth-01.azurewebsites.net/Account/ForgotPassword

The web and technician apps use the hosted API. The API stores relational records in Azure SQL and confirmed field files in Azure Blob Storage. The API's ready endpoint should be healthy before diagnosing missing data or file links.

Android APK Download the signed build from SmartJob Android Build on GitHub Actions. Open a successful main/develop push or manual run and select its smartjob-android-apk artifact. See section 2 for phone installation steps.

14 Glossary and support

Term	Meaning
Job card	The customer/site work record, assignment, checklist, evidence and status.
Standard Job Card	The one checklist template copied into every new job.
Flag	An issue raised against a job; it needs follow-up and can block approval.
Awaiting approval	Technician submitted the job for manager review.
Reopened	The manager returned a job for rework with a reason.
Confirmed evidence	A file whose upload was accepted and linked to the job by the API.
Offline Sync	The app page for pushing supported queued checklist updates and checking conflicts.

For access, data or workflow problems, contact the SmartJob administrator or the Group 20 project team through the person who provided the app. Include the job number, screen, approximate time and exact error text. Share customer photos or signatures only through approved channels.

Revision history

Version	Date	Change
1.0	20 September 2026	Original user guide for the early build.
2.0	5 October 2026	Hosted URLs, Android APK installation, current web/mobile screens, job-card PDF, reporting, rework and email notifications.
