> **Fast route** Managers: sections 2-11. Technicians: sections 2-3 and 12-17. Troubleshooting is in section 18. The signed Android APK is embedded in this PDF, so a private GitHub account is not needed.

1 What SmartJob does

Verteco SmartJob replaces fragmented paper and message-based field records with one job card. A manager schedules work in the web console. A technician records work and evidence in the Android app. The manager can then review, approve or return the same record for correction.

Role	Main tasks	Access
Manager	Create customers, sites, technicians and jobs; assign work; resolve flags; inspect evidence; approve or reopen jobs; export reports.	Hosted web console
Technician	View assigned work; record checklist, equipment and comments; add photos and signatures; flag issues; submit and sync.	Android app

How the information moves

Both clients call the hosted API. It applies role and workflow rules, stores job and account records in Azure SQL, and links confirmed photos and signatures held in private Azure Blob Storage. The same job card is visible across both clients after successful synchronisation.

Stage	What changes
Draft	A manager has created a job but has not assigned a technician.
Assigned / Accepted / In Progress	The technician receives the work, accepts it and records field activity.
Awaiting Approval	The technician submitted the completed job for manager review.
Completed / Reopened	The manager approved it or returned it with a reason for more work.
Cancelled	The manager stopped a permitted active job. A flag may also exist alongside a status.

2 Requirements and first-time setup

Before you start

Manager web	Technician Android
A current desktop browser, internet access, a manager account and its sign-in email/password.	Android 5.0 or later, the signed APK attached to this PDF, a technician account created by a manager, and internet for initial sign-in.
Allow the web console to reach the hosted API. Use an up-to-date browser for PDF exports.	Allow camera or photo selection when prompted. Keep enough local storage for photos and queued offline work.

Manager web address: https://verteco-smartjob-web-ctatfjduapbcdzb5.southafricanorth-01.azurewebsites.net

Install the technician app from this PDF

1. Save the full PDF to a computer and open it in **Adobe Acrobat Reader**. Open **Attachments** (paperclip icon). Browser and phone previews may hide PDF attachments.
2. Save **za.co.verteco.smartjob-Signed.apk** from Attachments. Move that APK to the Android phone through USB or another approved transfer method.
3. On the phone, open the APK in Files/Downloads and tap **Install**. If Android asks, allow this one installation from the Files app; turn that allowance off afterwards.
4. Open SmartJob. Sign in using the technician email and password supplied by the manager. A manager account is not a technician app account.

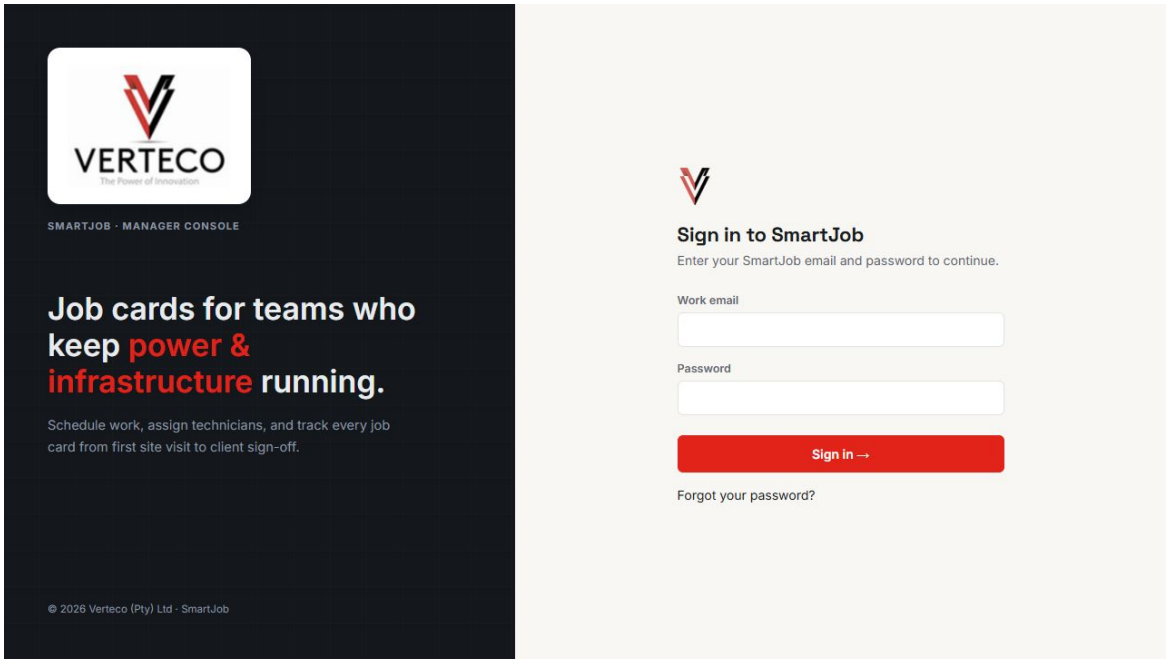
Keep your work Before replacing or uninstalling the app, open Offline Sync and confirm that pending operations and conflicts are both zero. An uninstall may remove work still stored only on the phone.

APK authenticity The attachment is the supplied signed version 1.0 installer for package za.co.verteco.smartjob. SHA-256: 8840B3551D3E6FB2D096F8CCA0F6845EE2A837B2C7D919ABF2BB2773A27B30A0.

3 Sign in and reset a password

Manager web sign-in

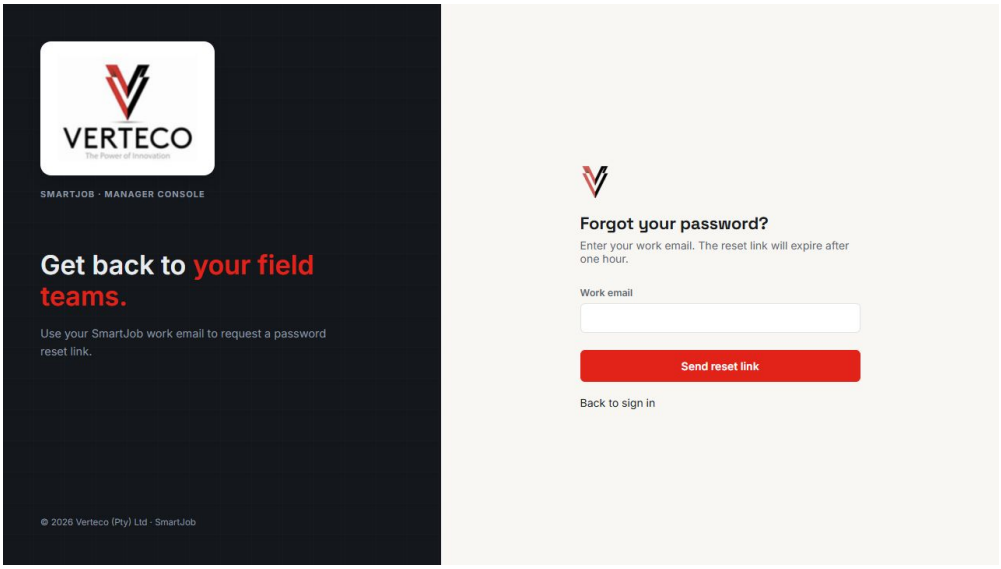
1. At the hosted web address, enter your work email and password in the labelled fields, then select **Sign in**.
2. If the app reports that sign-in is temporarily unavailable, verify your connection and contact the administrator if the hosted API is unreachable.
3. After five wrong password attempts, an account may be locked for 15 minutes. The web screen shows a countdown. Wait for the countdown instead of repeatedly retrying.



Manager sign-in page with Work email, Password and Sign in.

Forgotten manager password

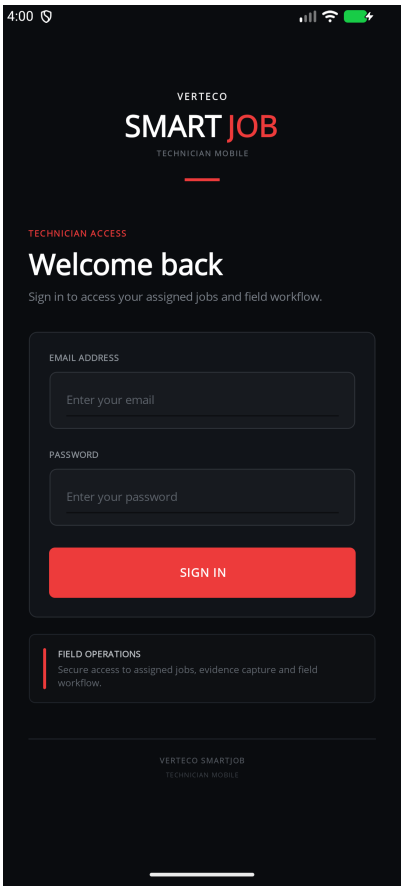
1. Select **Forgot your password?** on the sign-in page. Enter the account's sign-in email under Work email and choose **Send reset link**.
2. Check the inbox and spam folder. Only an active, registered address receives a reset email, but the page uses the same response for every address to protect account privacy.
3. Open the link within one hour, choose a new password and sign in. If no email arrives, ask the administrator to confirm your registered email and mail service.



Password reset request page with Work email and Send reset link.

Technician sign-in

The technician app uses a technician account linked to the roster. Only a manager can create that account or set its password. The mobile login screen does not provide a reset-link flow; ask a manager to set a replacement password if necessary.

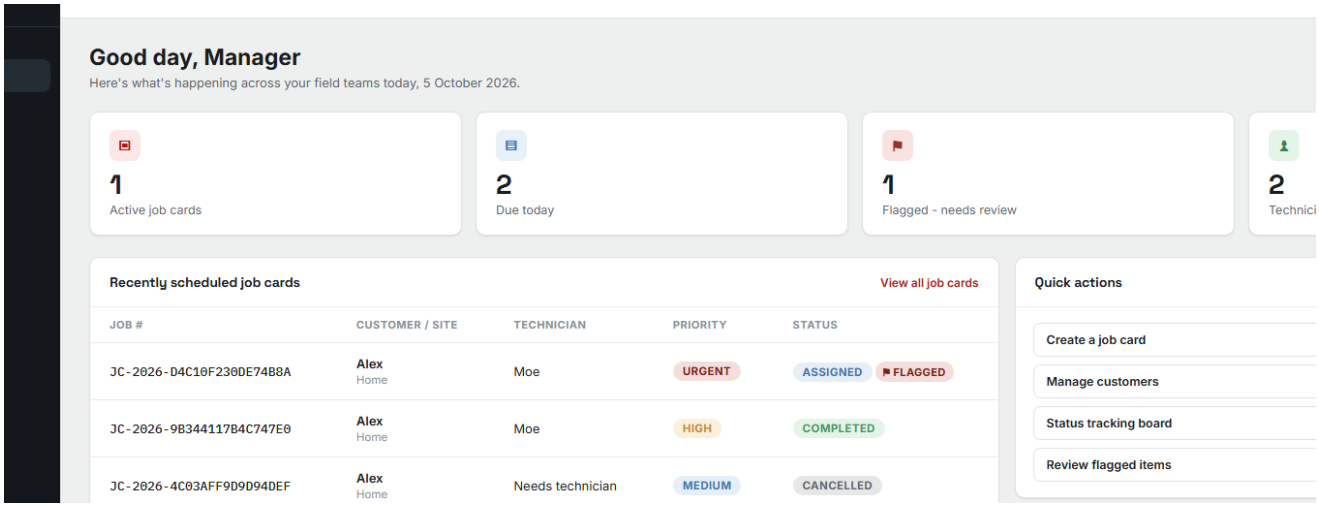


Technician app sign-in: email, password and sign-in action.

4 Manager dashboard

The dashboard is the manager's starting point. Its summary cards highlight active jobs, jobs due today, flagged work and available technicians. Recent jobs open their details; quick actions lead to common tasks.

1. Read the summary cards for work needing attention.
2. Select a job in the recent list to inspect its status and evidence.
3. Use Quick actions to create a job, open tracking or review flagged items.



Manager Dashboard with summary cards, recent jobs and quick actions. Example data may differ.

What to check first Review flagged jobs and Awaiting Approval jobs each day. A dashboard count is a summary; open the job card before taking action.

5 Customers and sites

A customer can have multiple sites. A job must point to a site belonging to its selected customer, so the job form filters the site list after you choose a customer.

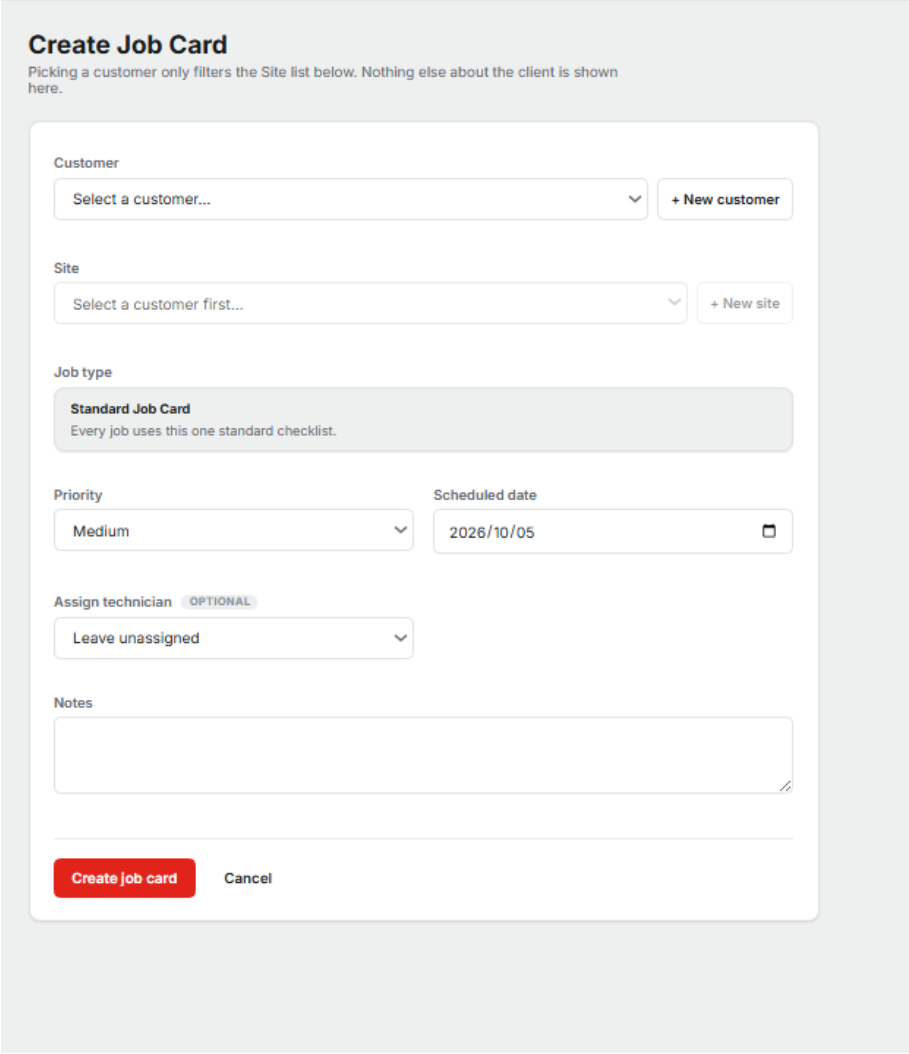
1. Open **Customers** to search by customer name, inspect contact details and view the number of sites. Select **New customer** to add one; open an existing customer to review or edit it.
2. Open **Sites** to search locations, see the parent customer and equipment count, or select **New site** to add one. Open a site to check or edit its details.
3. When creating a job, use **New customer** or **New site** beside the selectors if the record is missing. Return to the form and select the newly created record.

> **Avoid duplicates** Search before adding a customer or site. Check the site address and parent customer because a similar site name may exist under another customer.

6 Create and assign a job

Every job uses the Standard Job Card checklist. Priority, schedule and technician assignment tell the field team what needs attention and when.

1. Open **Create Job Card**. Choose a customer, then choose one of that customer's sites.
2. Set the priority, scheduled date and optional technician. Add instructions or access details in Notes.
3. Review the form and select **Create job card**. If no technician was selected, the job remains Draft.
4. To assign a Draft job later, open its details and use the assignment form. The current details form asks for the technician's record ID; you can avoid this by selecting the technician during creation.



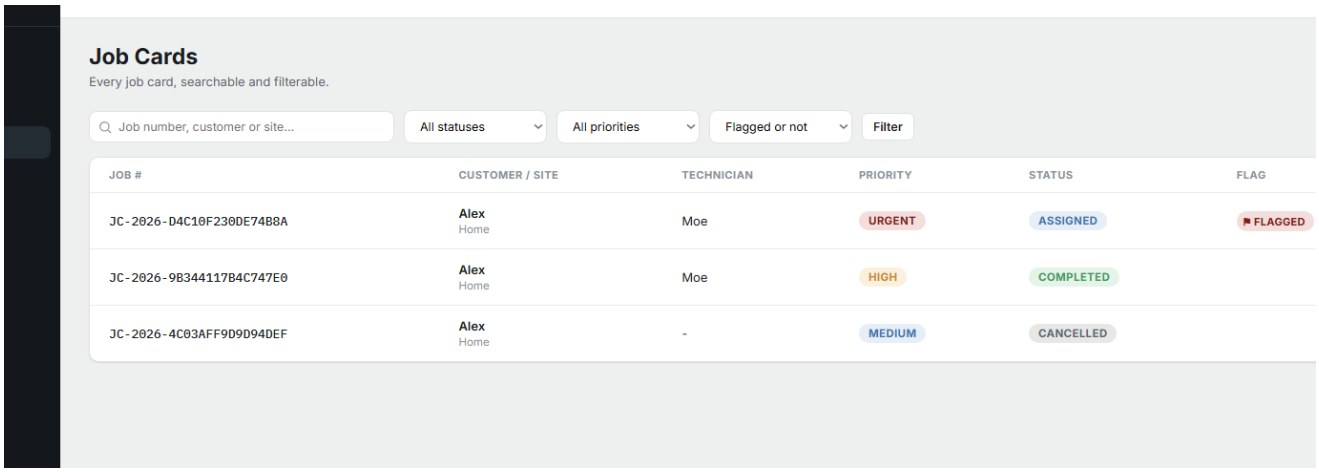
Create Job Card form with customer, site, priority, schedule, technician and notes.

The standard checklist

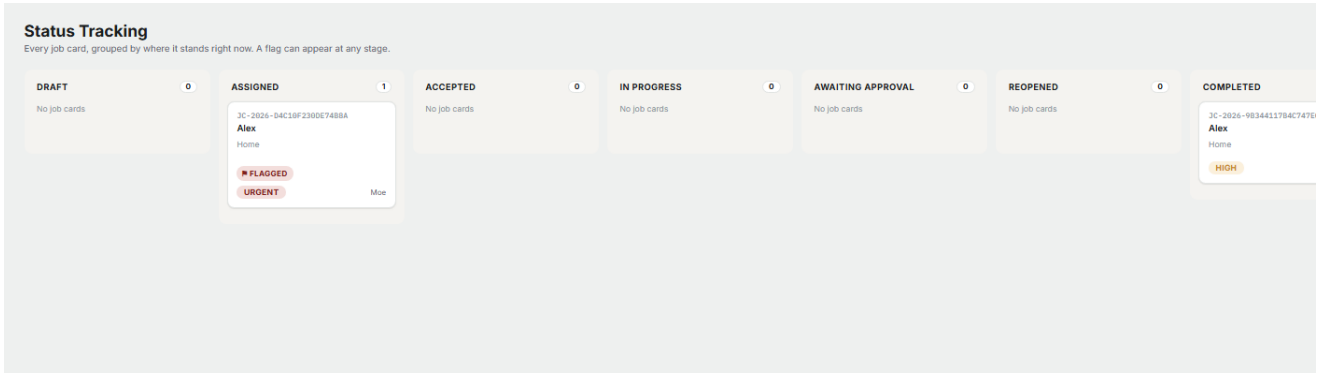
Work area	Technician action
Site safety	Confirm access and site safety controls after checking them.
Equipment	Record equipment name/type and serial number; use a previously recorded asset at the site where suitable.
Work and tests	Complete the required work and record checklist responses.
Evidence	Add clear job photos, with descriptions where useful.
Sign-off	Capture technician and client names, signatures and confirmations.

7 Find and track jobs

1. Open **Job Cards**. Use search and filters to narrow by job number, customer, site, status, priority or flag.
2. Select a result to open the complete job detail. Check who is assigned, what remains and whether any flag is open.
3. Open **Status Tracking**. Each column groups jobs by stage. Select a card to inspect it.



Job Cards list with search, filters and selectable results.



Status Tracking groups selectable job cards by stage.

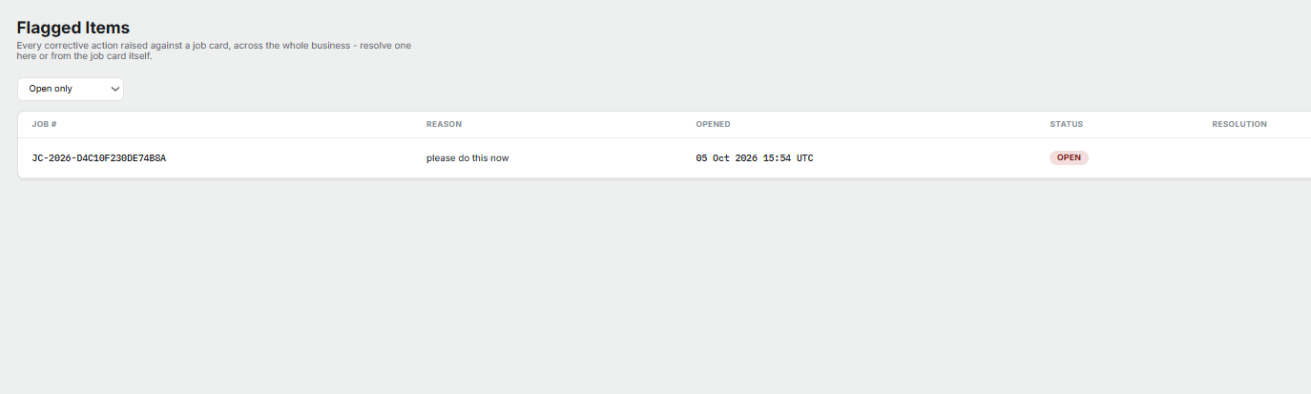
The board can show Draft, Assigned, Accepted, In Progress, Awaiting Approval, Reopened, Completed and Cancelled. Counts change as work progresses. A flag is a separate issue marker; it does not replace the job status.

8 Flags and equipment history

Resolve a flagged issue

A technician can flag a job from the app; a manager can raise one from the job details. A flag may refer to safety, access, missing equipment or another issue.

1. Open **Flagged Items**. Use the Open only filter and read the reason and status.
2. Open the job and investigate the issue. Record corrective action. Use **Resolve** only after the issue is handled.
3. Return to the job card and confirm the flag state. An open flag blocks manager approval.



Flagged Items shows the reason, status and Resolve action.

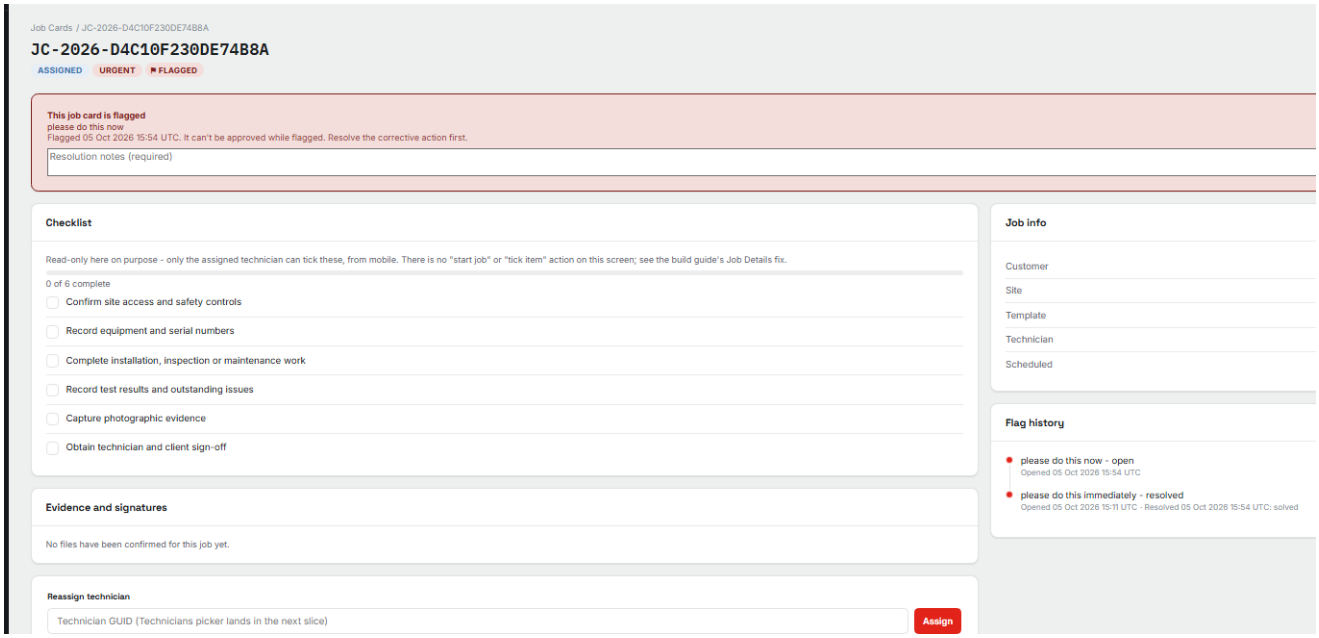
Find an asset's previous jobs

Open **Historical Records**, enter the equipment serial number, and select Search. Open a result to see its earlier job card. Use the serial, not just the equipment type, when checking repeat faults or warranty history.

9 Review evidence and approve

Inspect the complete job card

1. Open the job from Job Cards or Status Tracking. Check its customer, site, assignment, checklist, equipment and technician comments.
2. Under evidence and signatures, open each confirmed file. Select **View full job card** for the printable layout.
3. Use **Download PDF** to save the job record with confirmed evidence and signatures when available.



Job details with full job card, evidence links and PDF download.

Approve or return field work

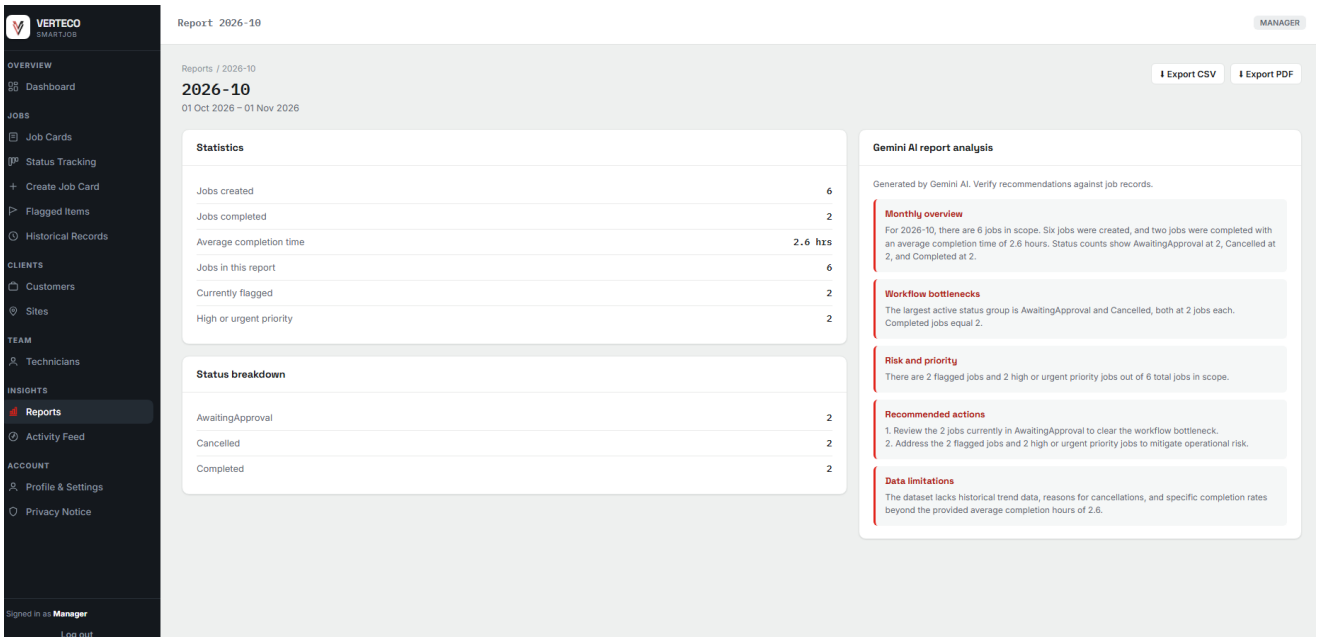
1. For an **Awaiting Approval** job, compare the job record with the actual work, including photos, signatures and open flags.
2. If complete and no open flag remains, add optional notes and select **Approve & complete**.
3. If correction is needed, enter a clear reason and select **Reopen for rework**. The technician receives the reason, edits eligible fields and resubmits.
4. If work must stop, use the permitted Cancel action on the job and record the reason where requested.

> **Evidence missing?** A photo or signature appears to the manager after its upload is confirmed by the API. Ask the technician to open Offline Sync, synchronise and check for conflicts, then refresh the web job card.

10 Reports and Gemini analysis

Reports show monthly job counts, completion time and a status breakdown. Gemini can add an advisory analysis with a monthly overview, bottlenecks, risks, recommended actions and data limitations. Verify its statements against the underlying jobs.

1. Open **Reports**, select the year and month, then read Statistics and Status breakdown before the AI commentary.
2. Read **Gemini AI report analysis** as advice. Compare its counts and recommendations with the report and the relevant job cards.
3. Use **Export CSV** or **Export PDF** in the upper-right corner. The PDF includes formatted AI insights when available.

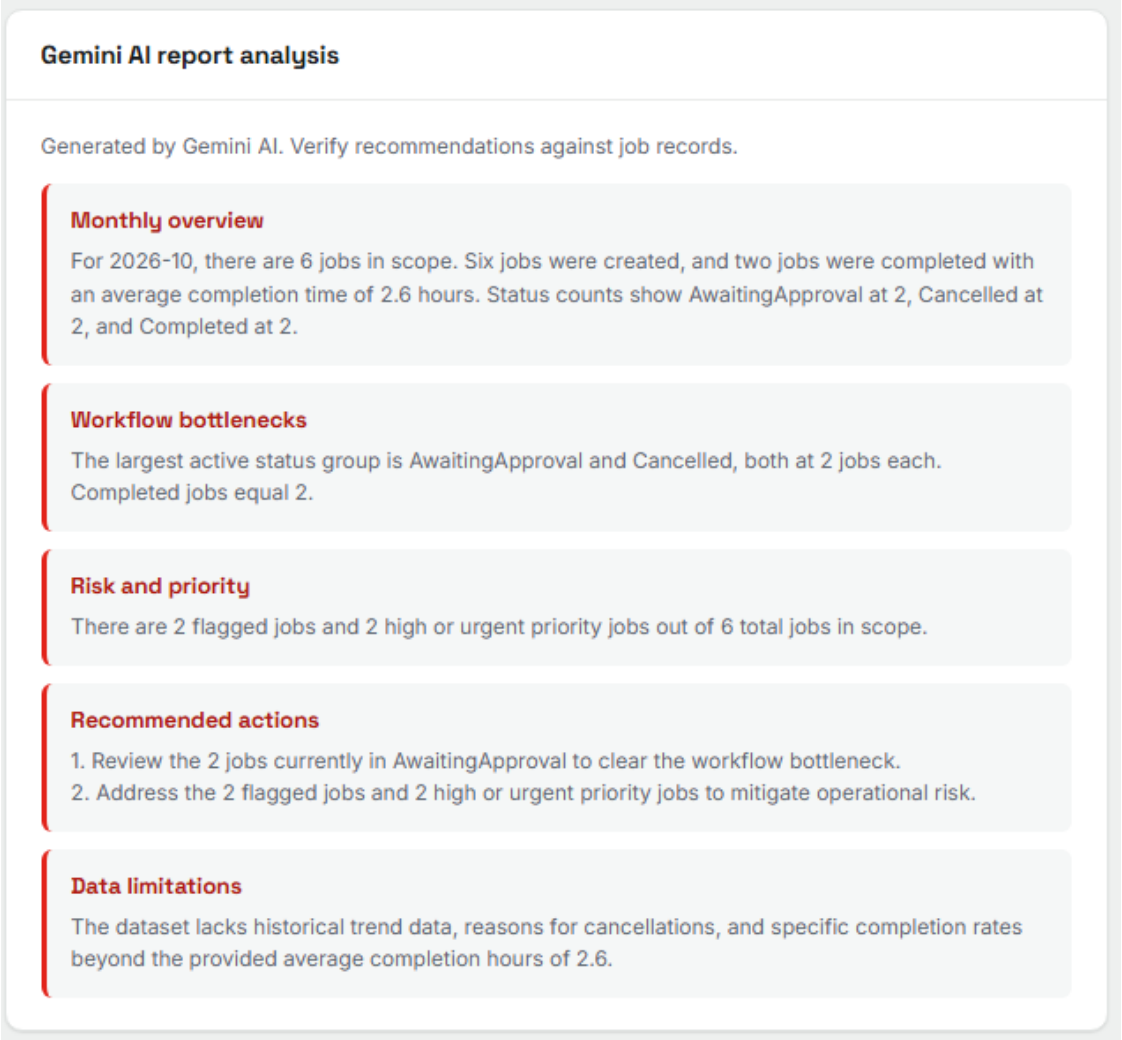


October 2026 report supplied for this guide, with statistics, status breakdown, Gemini analysis and export actions.

Read the Gemini analysis

The October example has six jobs in scope, two completed jobs, two flagged jobs and two high-or-urgent jobs. The AI groups its answer into five clearly labelled sections: Monthly overview, Workflow bottlenecks, Risk and priority, Recommended actions, and Data limitations.

Start with the overview, then use the bottleneck and risk sections to decide which job cards to inspect. Treat Recommended actions as prompts for review. The Data limitations section explains what the model could not infer from the available figures. The manager remains responsible for every approval, flag resolution and scheduling decision.



Unmodified close-up of the Gemini AI report analysis panel from the supplied October 2026 screenshot.

Limits The app limits AI report requests to 20 per minute. If a limit message appears, wait and retry. Do not submit the same report repeatedly to force an answer.

11 Technicians, accounts and settings

Create a technician account

1. As a Manager, open **Technicians** and choose **New technician**. Enter name, unique email, phone, skills and availability.
2. Save the record. SmartJob creates a linked technician account. Open that technician's details and set/confirm a sign-in password under User account.
3. Share the account details securely. The technician signs in to the Android app using that email. Only managers can create technician accounts or change their account state.
4. Use the same detail page to edit the roster, suspend/reactivate or deactivate the account. A suspended account cannot sign in until reactivated.

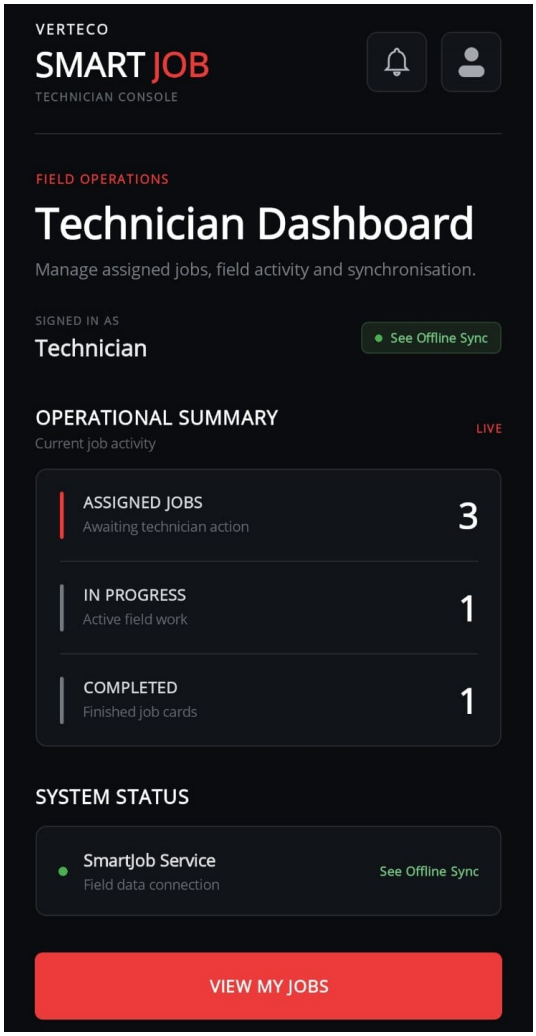
Profile, activity and privacy

Profile & Settings lets the manager edit name, sign-in email and phone. Changing the sign-in email requires the current password. It also links to password reset and logout. **Activity Feed** lists recorded sign-ins, job actions and account changes with timestamps. **Privacy Notice** explains stored data, access controls and long-term job-record retention.

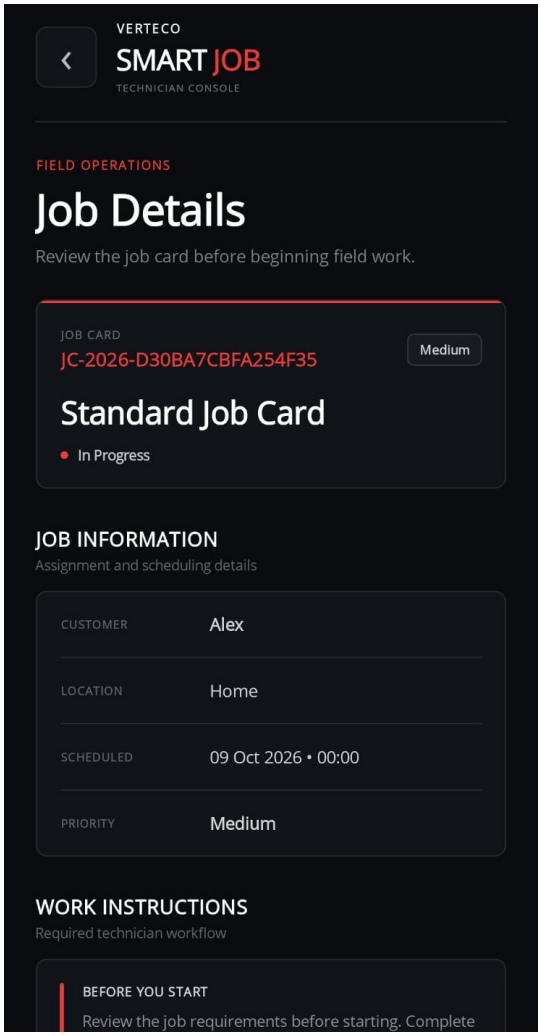
SmartJob currently sends job email from **vertecosmartjob@gmail.com**. Manager alerts for submitted or flagged jobs go to the active manager's SmartJob sign-in email. Assignment, approval and reopening alerts go to the technician's account email. Keep those addresses current and check spam if a message does not arrive.

12 Technician dashboard and jobs

1. Sign in using the technician account. On Dashboard, tap the bell icon for notifications.
2. Read the Assigned, In Progress and Completed counts. Tap **VIEW MY JOBS**.
3. Open an assigned job. Review the job number, customer, site, schedule and priority. Accept/start the job when ready; continue an In Progress job from its details.



Technician Dashboard with notifications, job counts and View My Jobs.

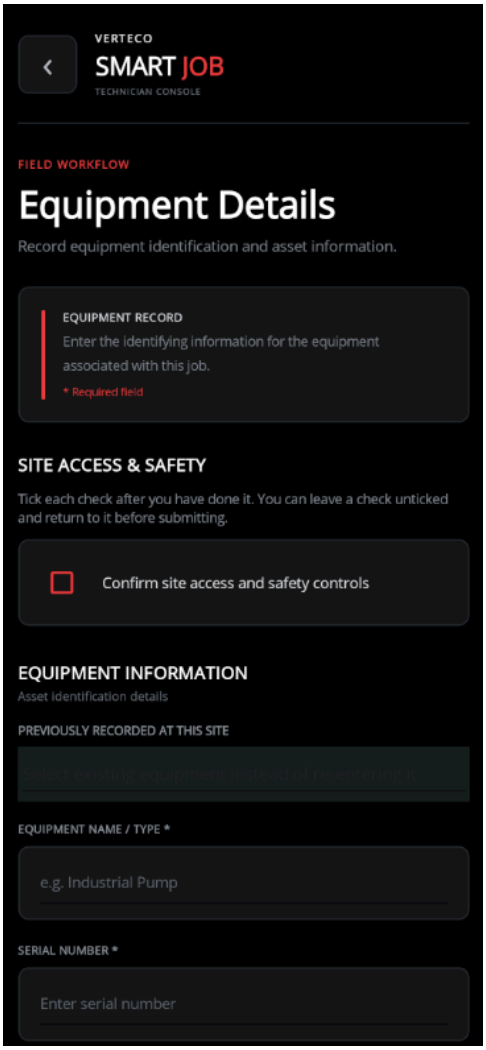


Job Details with priority, customer, site, schedule and instructions.

My Jobs includes work allocated to the signed-in technician, including reopened jobs. If a job is missing, refresh while online and ask the manager to check the assignment and account email.

13 Checklist and equipment

1. On Job Details, choose **CONTINUE JOB** or the relevant start action. Read the instructions before marking a check complete.
2. At **Equipment Details**, confirm site access and safety controls only after checking them. Enter equipment name/type and serial number, or choose a previously recorded asset at this site where offered.
3. Work through the standard checklist and save each response. Do not tick a task just to proceed; incomplete items are surfaced at final review.
4. Check that the equipment serial is accurate: Historical Records uses that value to link future service visits.



Equipment Details and site safety check from the technician workflow.

Working offline The current app can queue checklist and equipment edits locally. Open Offline Sync after reconnecting, tap SYNC NOW and verify the pending count reaches zero before final submission.

14 Photos, comments and flags

Add one or more photos

1. Open **Photo Evidence**. Tap **TAKE PHOTO** or **CHOOSE PHOTO FROM DEVICE** and grant access if prompted.
2. Review the selected image, optionally enter a useful description, then tap **ADD PHOTO TO JOB**. Repeat for every view needed to prove the work.
3. The Saved Job Photos list shows confirmed images. Edit a description with Save Description, or remove an incorrect saved photo when online. Queued Photos shows images not yet uploaded.
4. After reconnecting, open Offline Sync and tap SYNC NOW. Confirm pending evidence uploads are zero and check the job again before submission.

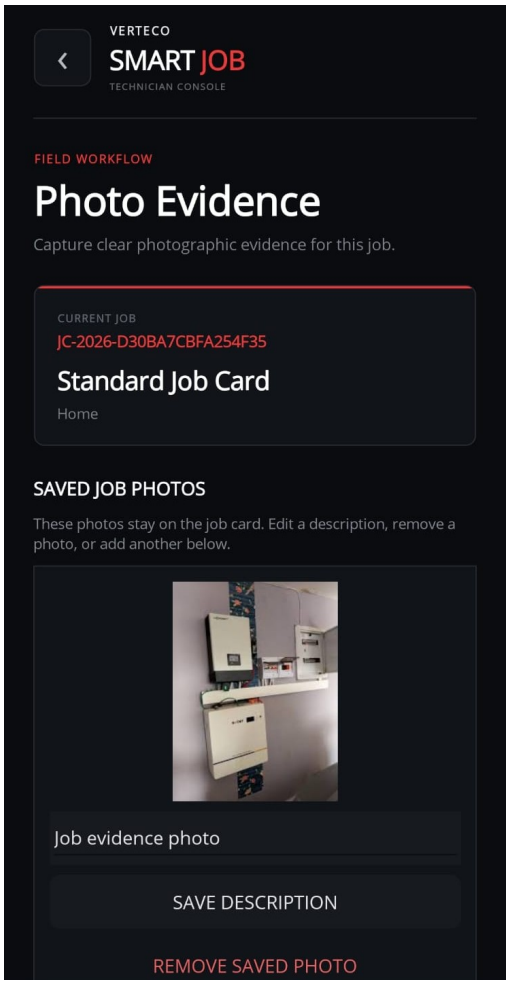


Photo Evidence showing a saved photo and its description controls.

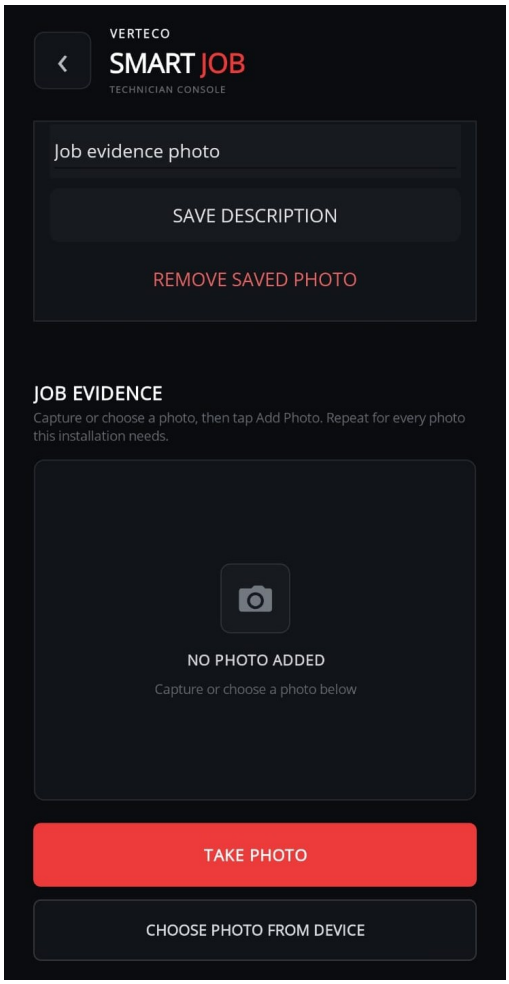

Photo capture controls for camera and device images.

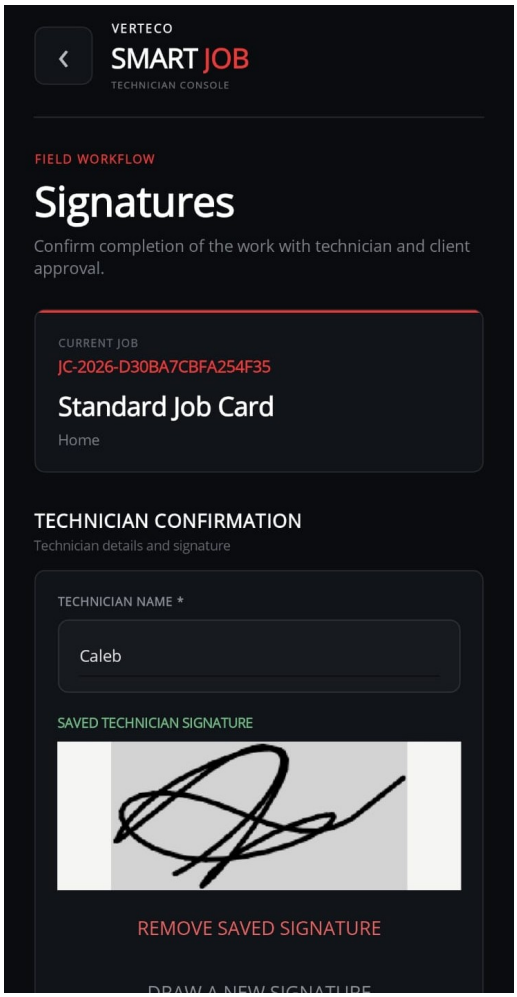
Comments and issue reporting

On **Comments & Flag**, enter observations or additional information, then save. To escalate a problem, enable **FLAG THIS JOB**, select a reason and provide the required detail. The manager can see the open flag in Flagged Items and on the job. Comments and flags can queue offline; verify synchronisation before the manager reviews them.

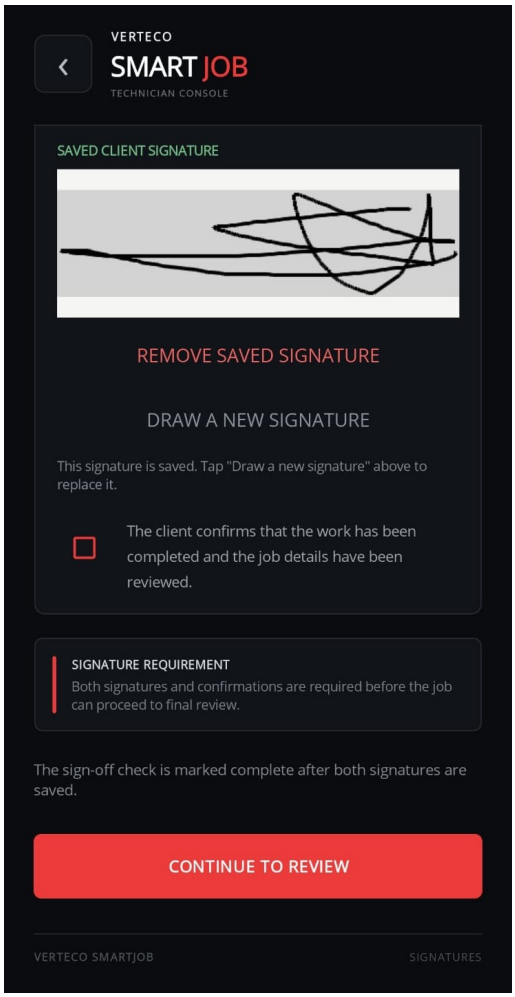
15 Signatures and final submission

Capture both sign-offs

1. At **Signatures**, enter the technician's full name, draw and save the technician signature, and confirm the technician's work. A saved signature can be removed or replaced with Draw a new signature.
2. Ask the client to review the work. Enter the client's full name, obtain and save the client signature, then tick the client confirmation box.
3. Use **CONTINUE TO REVIEW**. Both signatures and confirmations are required. An offline capture is queued locally and must synchronise before submission.



Technician sign-off: name and saved signature.



Client sign-off: saved signature and confirmation.

Review and submit

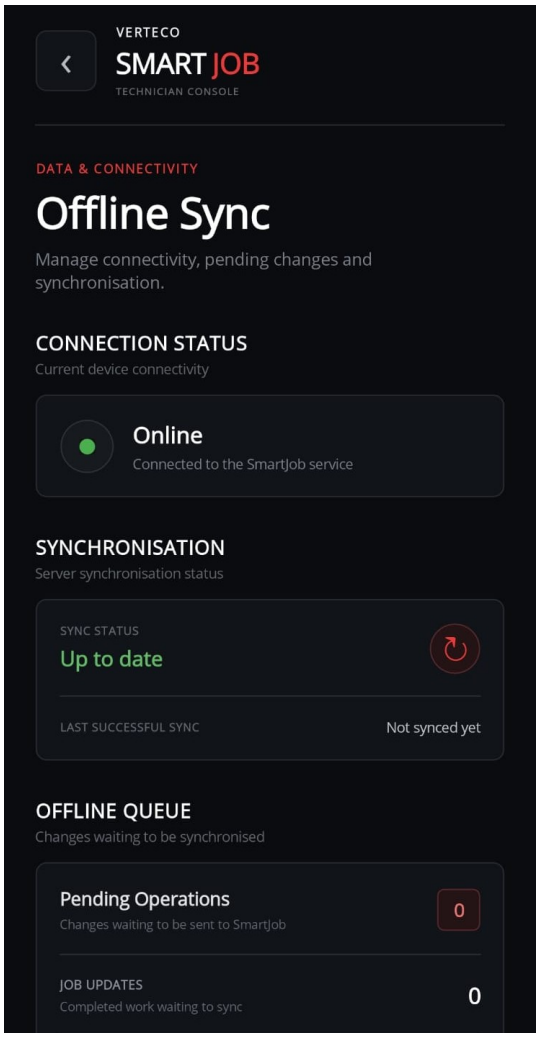
Read the final review for missing checklist items, evidence or signatures. Tick the review confirmation. Final submission requires an internet connection. First open Offline Sync, tap SYNC NOW, confirm no pending items or conflicts, then submit. A successful submission changes the job to Awaiting Approval; the manager then receives a notification.

> **Privacy of signatures** The supplied screenshots show example signatures. Check that any guide you distribute has permission to show the signatures and job details it contains.

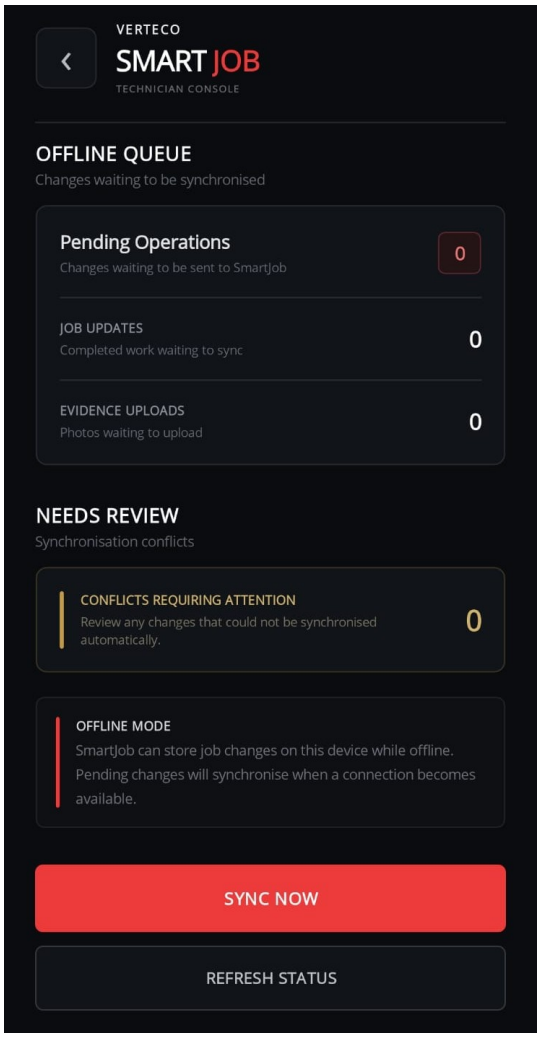
16 Offline Sync

The app can store work on the phone when connectivity drops. Supported queued changes include checklist responses, equipment, comments, flags, photos and both signatures. The Offline Sync screen is the place to send them and inspect problems.

1. From Dashboard select **See Offline Sync**. Read Connection Status, Sync Status and Last Successful Sync.
2. Review Pending Operations, Job Updates and Evidence Uploads. These counts show what has not yet reached the server.
3. When online, tap **SYNC NOW**. Wait for it to finish, then tap Refresh Status and confirm the pending counts are zero.
4. If Conflicts Requiring Attention is above zero, inspect the sync status, reload the job and compare server data before editing again. Ask a manager/administrator if a conflict persists; do not assume the queued edit was applied.
5. Open the job again and verify the saved changes. Submit only while online after all required evidence and signatures are confirmed.



Offline Sync showing connection, status and last successful sync.



Offline queue, conflicts and the SYNC NOW action.

A zero queue is a useful check The screenshot shows zero pending changes before a first recorded sync. Up to date alone does not prove an earlier offline change reached the server. Use SYNC NOW, refresh and reopen the job to verify.

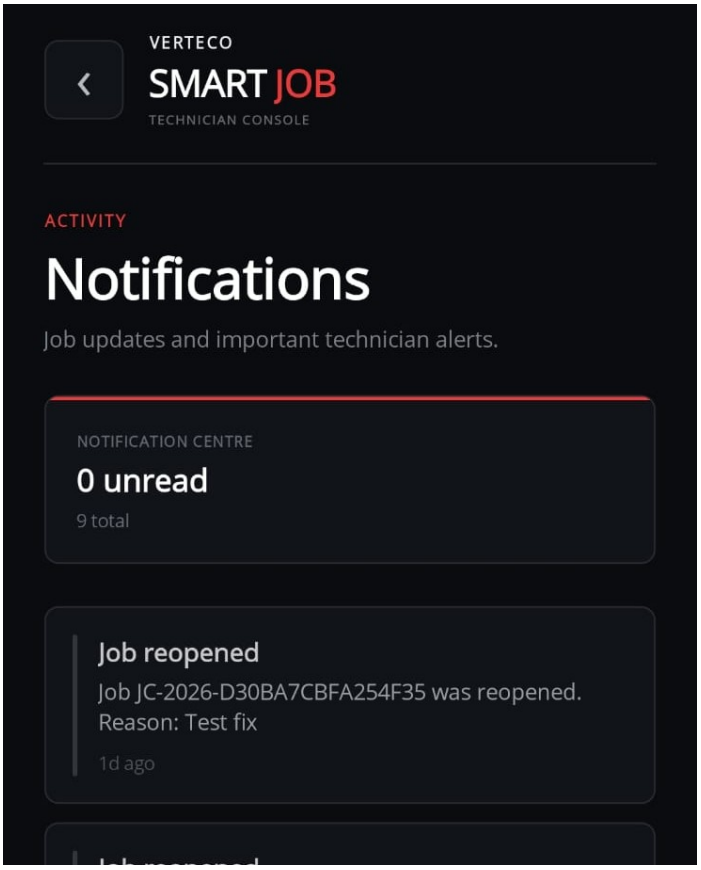
17 Rework and notifications

Resume a reopened job

1. Open the bell or My Jobs and select the Reopened job. Read the manager's reason before changing anything.
2. Tap **Resume reopened job**. Existing checklist answers, comments, photos and signatures remain available. Correct the requested work, replacing evidence or signatures where needed.
3. Synchronise any queued changes, complete the review again and submit while online. The manager reviews the new submission.

In-app notifications

The bell opens Notifications. The top panel shows unread and total counts. Tap an item to read it and mark it read; use Mark All Read when available. Typical items include assignment, approval and reopening. In-app notifications do not replace checking the actual job card.



Notifications showing unread count and job updates with reasons.

Technician profile and logout

Use the person icon on Dashboard to view your technician profile and account details. If the displayed information is wrong, ask a manager to edit the roster or linked account. Use the profile's logout action when handing over or leaving a shared device, after confirming that offline work has synchronised.

18 Troubleshooting and FAQs

Symptom	Action
Cannot see APK in PDF	Download the complete PDF and open it in Adobe Acrobat Reader on a computer. Use Attachments/paperclip. Browser preview often hides embedded files.
Android says app not installed	Confirm you extracted the signed APK, not the PDF. Allow installation from Files when prompted. For an update failure, ask the administrator to verify signing continuity; sync before uninstalling.
Manager web says sign-in unavailable	Check connection. Ask an administrator to check the hosted API and readiness endpoint; the browser may be working while the API is not.
Wrong password / countdown	Check the correct role and email. After five wrong attempts, wait for the 15-minute lockout countdown. Do not keep retrying.
Reset email missing	Only active registered addresses receive the one-hour link. Check spam, confirm your sign-in email and ask the administrator to check mail delivery. The request page does not reveal account existence.
Technician cannot sign in	A manager must create the technician and set its linked account password. Check that the account is active, the API is reachable and the email is the technician email.
Assigned job missing	Refresh My Jobs online and verify the assignment on the manager web job card. Confirm the technician signed in with the assigned account.
Photo or signature missing in web	Open Offline Sync, tap SYNC NOW and check pending uploads/conflicts. Refresh the manager job card after confirmation.
Cannot submit	Complete the checklist, both names/signatures/confirmations and review; clear the offline queue and connect to the internet. Final submission is online only.
Conflicts remain	Read the sync status, reload the current server job and reconcile changes. Contact an administrator with job number and exact error if unresolved.
AI analysis unavailable	Use report statistics/exports. Retry later after the rate window; ask an administrator to check Gemini configuration if it persists.
Email alert missing	Check inbox/spam for vertecosmartjob@gmail.com and verify the active account's sign-in email. Ask the administrator to check delivery logs.

Before contacting support

Record the job number, device/browser, approximate time, which button you pressed, the exact message and whether Offline Sync shows pending operations or conflicts. Do not send passwords, signing keys or unredacted client signatures in an ordinary message.

19 Reference, privacy and support

Addresses and readiness

Item	Address or use
Manager web	https://verteco-smartjob-web-ctatfjduapbcdzb5.southafricanorth-01.azurewebsites.net
Hosted API	https://verteco-smartjob-api-hcdyfgf4cagdh2db.southafricanorth-01.azurewebsites.net Used by web and Android clients.
API readiness	https://verteco-smartjob-api-hcdyfgf4cagdh2db.southafricanorth-01.azurewebsites.net/health/ready Administrator check for API dependencies.

Security and records

The API enforces manager and technician roles. Only managers can create technician accounts and approve jobs. Passwords are stored as hashes, not plain text; login attempts are rate limited, and a repeated-failure account lockout applies. Confirmed photos and signatures are stored privately. The audit feed records significant account and job actions. Job records, photos and signatures are retained for service, warranty and maintenance history as described in the Privacy Notice.

Terms

Term	Meaning
Job card	A single work record connecting customer, site, schedule, checklist, evidence, sign-off and status.
Flag	An issue raised against a job that requires manager attention and can block approval.
Awaiting Approval	A technician has submitted the job for manager review.
Reopened	The manager returned the job with a reason for correction.
Pending Operation	A phone change still waiting to reach the server.
Sync conflict	A queued change could not be applied automatically; review the current server record.

Revision and assistance

Version 5.0, 31 October 2026. This revision uses the supplied October report screenshot, removes all screenshot overlays, and keeps the current multi-photo workflow, offline queue, notifications, signatures, sign-in and reporting guidance. Screens use example data; live counts and records may differ.

For account or data problems, contact your SmartJob manager or administrator. For installation, provide this complete PDF so the embedded APK can be extracted without access to the private repository.
